

Server-Instance Descriptor Element

A `server-instance` element deploys an instance of a [server-template](#) element on a node.

This element may only appear as a child of a `node` element.

The following attributes are supported:

Attribute	Description	Required
<code>template</code>	Identifies the server template .	Yes

All other attributes of the element must correspond to [parameters](#) declared by the template. The `server-instance` element must provide a value for each parameter that does not have a default value supplied by the template.

Here is an example to demonstrate the use of this element:

XML
<pre><icegrid> <application name="SampleApp"> <server-template id="ServerTemplate"> <parameter name="id"/> <server id="\${id}" activation="manual" .../> </server-template> <node name="Node1"> <server-instance template="ServerTemplate" id="TheServer" /> </node> </application> </icegrid></pre>
