

Filtering Administrative Facets

The Ice run time enables all of its built-in [administrative facets](#) by default, and an application may install its own [custom facets](#). You can control which facets the Ice run time enables using the [Ice.Admin.Facets](#) property. For example, the following property definition enables the `Properties` facet and leaves the `Process` facet (and any application-defined facets) disabled:

```
Ice.Admin.Facets=Properties
```

To specify more than one facet, separate them with a comma or white space. A facet whose name contains white space must be enclosed in single or double quotes.
