

# Property Set Descriptor

A Property Set defines a set of Ice properties. IceGrid Admin supports two kinds of Property Sets:

- **Named Property Set**  
A property set defined within an [application](#) or within a [node](#). Server and service definitions refer to such property sets to "include" the corresponding properties.
- **Service-Instance Property Set**  
A property set defined as a child of an [IceBox server instance](#). Such a property set provides properties to a service instance within a concrete IceBox server.

## Properties

The Property Set Properties panel offers the following fields:

- **ID** (Named Property Set only)  
The ID of a named property set.
- **Service Name** (Service Instance property set)  
The service name.
- **Property Sets**  
List of Property Set IDs. The corresponding property sets are "included" in this property set.
- **Properties**  
Ice properties private to this Property Set
