

Service Template Descriptor

A service template is used to capture the common definitions of several similar or identical services.

On this page:

- [Properties](#)
- [Children](#)

Properties

The Service Template Properties panel offers the following fields:

- **Template ID**
The ID the template. Must be unique within the application.
- **Parameters**
The list of parameters for this template. Each parameter can have an optional default value.
- **Plain Service Properties**
The remaining fields are the [Plain Service](#) fields.

Children

A service template can have two types of children:

- [Adapter](#)
- [Database Environment](#)
