

# IcePatch2 Properties

On this page:

- [IcePatch2.AdapterProperty](#)
- [IcePatch2.Directory](#)
- [IcePatch2.InstanceName](#)

## IcePatch2.AdapterProperty

### Synopsis

`IcePatch2.AdapterProperty=value`

### Description

IcePatch2 uses the adapter name `IcePatch2` for the server. Therefore, [adapter properties](#) can be used to configure this adapter.

## IcePatch2.Directory

### Synopsis

`IcePatch2.Directory=dir`

### Description

The IcePatch2 server uses this property to determine the data directory if no data directory is specified on the command line.

This property is also used by IcePatch2 clients to determine the local data directory.

## IcePatch2.InstanceName

### Synopsis

`IcePatch2.InstanceName=name`

### Description

Specifies the identity category for well-known IcePatch2 [objects](#). If defined, the identity of the `IcePatch2::Admin` interface becomes `name/admin` and the identity of the `IcePatch2::FileServer` interface becomes `name/server`.

If not defined, the default value is `IcePatch2`.
