

IceGrid-UserAccountMapper

IceGrid::UserAccountMapper

Overview

interface UserAccountMapper

A user account mapper object is used by IceGrid nodes to map session identifiers to user accounts.

Operation Index

[getUserAccount](#) — Get the name of the user account for the given user.

Operations

string getUserAccount(string user) throws [IceGrid::UserAccountNotFoundException](#)

Get the name of the user account for the given user. This is used by IceGrid nodes to figure out the user account to use to run servers.

Parameters

user — The value of the server descriptor's `user` attribute. If this attribute is not defined, and the server's activation mode is `session`, the default value of `user` is the session identifier.

Return Value

The user account name.

Exceptions

[IceGrid::UserAccountNotFoundException](#) — Raised if no user account is found for the given user.
