

Ice-Process

Ice::Process

Overview

interface Process

An administrative interface for process management. Managed servers must implement this interface.

A servant implementing this interface is a potential target for denial-of-service attacks, therefore proper security precautions should be taken. For example, the servant can use a UUID to make its identity harder to guess, and be registered in an object adapter with a secured endpoint.

Operation Index

[shutdown](#) — Initiate a graceful shut-down.

[writeMessage](#) — Write a message on the process' stdout or stderr.

Operations

void shutdown()

Initiate a graceful shut-down.

See Also

- [Ice::Communicator::shutdown](#)

void writeMessage(string message, int fd)

Write a message on the process' stdout or stderr.

Parameters

`message` — The message.

`fd` — 1 for stdout, 2 for stderr.
