Operation Index

authorize — Check whether a user has permission to access the router.

Operations

["nonmutating", "format:sliced"] bool authorize(Glacier2::SSLInfo info, out string reason) throws Glacier2::PermissionDeniedException

Check whether a user has permission to access the router.

Parameters

info — The SSL information.
reason — The reason why access was denied.

Return Value

True if access is granted, or false otherwise.

Exceptions

Glacier2::PermissionDeniedException — Raised if the user access is denied. This can be raised in place of returning false with a reason set in the reason out parameter.
