

MATLAB Mapping for Identifiers

A Slice [identifier](#) maps to an identical MATLAB identifier. For example, the Slice identifier `clock` becomes the MATLAB identifier `clock`. There is one exception to this rule: if a Slice identifier is the same as a MATLAB keyword, the corresponding MATLAB identifier is suffixed with an underscore. For example, the Slice identifier `while` is mapped as `while_`.

 You should try to [avoid such identifiers](#) as much as possible.
