

Log Descriptor Element

A `log` element specifies the name of a log file for a server or service. A `log` element must be defined for each log file that can be [accessed remotely](#) by an administrative tool. Note that it is not necessary to define a `log` element for the values of the `Ice.StdErr` and `Ice.Stdout` properties.

This element may only appear as a child of a [server](#) element or a [service](#) element.

The following attributes are supported:

Attribute	Description	Required
<code>path</code>	The path name of the log file. If a relative path is specified, it is relative to the current working directory of the node. The node must have sufficient access privileges to read the file.	Yes
<code>property</code>	Specifies the name of a property in which to store the path name of the log file as given in the <code>path</code> attribute.	No

Here is an example to demonstrate the use of this element:

XML

```
<server id="MyServer" ...>
  <log path="${server}.log" property="LogFile"/>
</server>
```
