slice2objc Command-Line Options

The Slice-to-Objective-C compiler, `slice2objc`, offers the following command-line options in addition to the standard options:

- `--include-dir DIR`
  Modifies `#import` directives in source files to prepend the path name of each header file with the directory *DIR*.

- `--output-dir DIR`
  Places the generated source files into the specified output directory *DIR*.

- `--depend`
  Prints makefile dependency information to standard output. No code is generated when this option is specified. The output generally needs to be filtered before it can be included in a makefile; the Ice build system uses the script `config/makedepend.py` for this purpose.

- `--depend-xml`
  Prints dependency information to standard output in XML format. No code is generated when this option is specified. This option is intended for use with Apple's Xcode development environment.
