

Log Descriptor Element

A log element specifies the name of a log file for a server or service. A log element must be defined for each log file that can be [accessed remotely](#) by an administrative tool. Note that it is not necessary to define a log element for the values of the `Ice.StdErr` and `Ice.Stdout` properties.

This element may only appear as a child of a [server](#) element or a [service](#) element.

The following attributes are supported:

Attribute	Description	Required
path	The path name of the log file. If a relative path is specified, it is relative to the current working directory of the node. The node must have sufficient access privileges to read the file.	Yes
property	Specifies the name of a property in which to store the path name of the log file as given in the path attribute.	No

Here is an example to demonstrate the use of this element:

XML
<pre><server id="MyServer" ...> <log path="\${server}.log" property="LogFile"/> </server></pre>
